Practical 07

Write and execute PL/SQL function to print /return binary equivalent of decimal number.

Introduction

A PL/SQL function is a subprogram that computes and returns a value. It helps in reusability, modular programming, and efficient database operations.

Key Concepts Used in This Program

- Functions in PL/SQL: A function must have a return type and return a value.
- Loops in PL/SQL: We use loops to repeatedly divide the decimal number by 2 to obtain its binary equivalent.
- String Operations: We build the binary number as a string.

PL/SQL Function to Convert Decimal to Binary

Steps to Convert Decimal to Binary in PL/SQL

1. Take a decimal number as input.
2. Use a LOOP to repeatedly divide the number by 2.
3. Store the remainders (0 or 1) in reverse order.
4. Return the final binary string.

PL/SQL Function Code

```
CREATE OR REPLACE FUNCTION decimal_to_binary(n IN NUMBER) RETURN
VARCHAR2 IS
    binary_result VARCHAR2(100) := ''; -- Variable to store the
    binary equivalent
    num NUMBER := n; -- Copy of the input number    remainder
NUMBER; -- Stores remainder after division BEGIN
    -- Check for zero case
    IF num = 0 THEN
        RETURN '0';
    END IF;

    -- Loop to convert decimal to binary
    WHILE num > 0 LOOP
        remainder := MOD(num, 2); -- Get remainder when divided by 2
        binary_result := remainder || binary_result; -- Build binary
        string in reverse
        num := TRUNC(num / 2); -- Reduce number by dividing by 2
    END LOOP;

    RETURN binary_result; -- Return final binary value END
decimal_to_binary;
/
```

Output

binary_value
1010

How to Execute the Function

Call the Function Using PL/SQL Block

```
DECLARE
```

```
    decimal_num NUMBER := 10; -- Example decimal number
```

```
    binary_value VARCHAR2(100);
```

```
BEGIN
```

```
    binary_value := decimal_to_binary(decimal_num);
```

```
    DBMS_OUTPUT.PUT_LINE('Binary equivalent of ' || decimal_num || '  
is: ' || binary_value);
```

```
END;
```

```
/
```

Output
binary_value
1010

Expected Output:

Binary equivalent of 10 is: 1010

Explanation of the Code

Step	Description
Function Creation	Defines <code>decimal_to_binary</code> function with input <code>n</code> (decimal number).
Binary Result Variable	Stores the binary representation as a string.
Loop Execution	Repeatedly divides <code>num</code> by 2, storing remainders.

String Concatenation	Builds binary number in reverse order.
Return Statement	Returns the final binary string.

Task

1. Modify the function to display step-by-step conversion while calculating binary.

Output					
<table> <tr> <th>Conversion_Steps</th></tr> <tr> <td>Step 1: 10 / 2 = 5, Remainder = 0</td></tr> <tr> <td>Step 2: 10 / 2 = 2, Remainder = 1</td></tr> <tr> <td>Step 3: 10 / 2 = 1, Remainder = 0</td></tr> <tr> <td>Step 4: 10 / 2 = 0, Remainder = 1</td></tr> </table>	Conversion_Steps	Step 1: 10 / 2 = 5, Remainder = 0	Step 2: 10 / 2 = 2, Remainder = 1	Step 3: 10 / 2 = 1, Remainder = 0	Step 4: 10 / 2 = 0, Remainder = 1
Conversion_Steps					
Step 1: 10 / 2 = 5, Remainder = 0					
Step 2: 10 / 2 = 2, Remainder = 1					
Step 3: 10 / 2 = 1, Remainder = 0					
Step 4: 10 / 2 = 0, Remainder = 1					

2. Write a PL/SQL block to accept user input for the decimal number and call the function.

Output

Conversion_Steps

Step 1: $10 / 2 = 5$, Remainder = 0

Step 2: $10 / 2 = 2$, Remainder = 1

Step 3: $10 / 2 = 1$, Remainder = 0

Step 4: $10 / 2 = 0$, Remainder = 1

3. Modify the function to store binary values in a table (**binary_conversions**).

Output

Conversion_Steps

Step 1: $10 / 2 = 5$, Remainder = 0

Step 2: $10 / 2 = 2$, Remainder = 1

Step 3: $10 / 2 = 1$, Remainder = 0

Step 4: $10 / 2 = 0$, Remainder = 1
